Classification in the Iris data set
A test example for `Jupyter nbconvert`

Abstract

This document is the result of a `nbconvert -to pdf` test on a very simple `ipython notebook`. Along with this abstract, title, author, affiliations, dates and keywords metadata are displayed. Furthermore this document should illustrate additional features; captions, labels, bibliography figures and tables rescaling, cells hiding. The orignal notebook was build so that to test multiple templates (see github.com/BreizhZut/Jupyter_nbconvert_pdftemplate) corresponding to documentation, article, book and presentations formats.

Keywords: Jupyter; ipython; nbconvert; template: PDF LaTeX

1 Data

The iris dataset is common test example for machine learning and can be found in the `datasets` packages of `R` or as in this instance the `sklearn` package in `python`. This data set was first published in [Fisher, 1936], in was further use for the purpose of testing machine learning classification algorithm such as in [Ro and Pe, 1973], [Dasarathy, 1980].

1. Number of Instances: 150 (50 in each of three classes)
2. Number of Attributes: 4 numeric, predictive attributes and the class
    - sepal length in cm
    - sepal width in cm
    - petal length in cm
    - petal width in cm
3. class:
    - Iris-Setosa
    - Iris-Versicolour
    - Iris-Virginica

1.1 Data frames

The 3 class are indicated in the data as integers 0, 1 and 2:

```
>>> # This should appear everywhere
... Counter(target)
Counter(0: 50, 1: 50, 2: 50)
```

With the corresponding class names:

```
>>> # This should appear everywhere
... list(target_names)
['setosa', 'versicolor', 'virginica']
```

We explore the first few element of the iris data set for each class:

- setosa encoded as 0 (see Table 1),
- versicolor encoded as 1 (see Table 2)
- virginica encoded as 2 (see Table 3).

We note that the row are ordered by class. This is not important here, since we try to test reference to some tables but for machine learning tasks it is advised to shuffle the row both in the data and the target.

2 Model

For fun were testing different classification models for the iris dataset using the Support Vector Classification (SVC) method. This exemple is taken from the`sklearn` documantation. We test the SVC methods with:

- a linear kernel (see Figure 2)

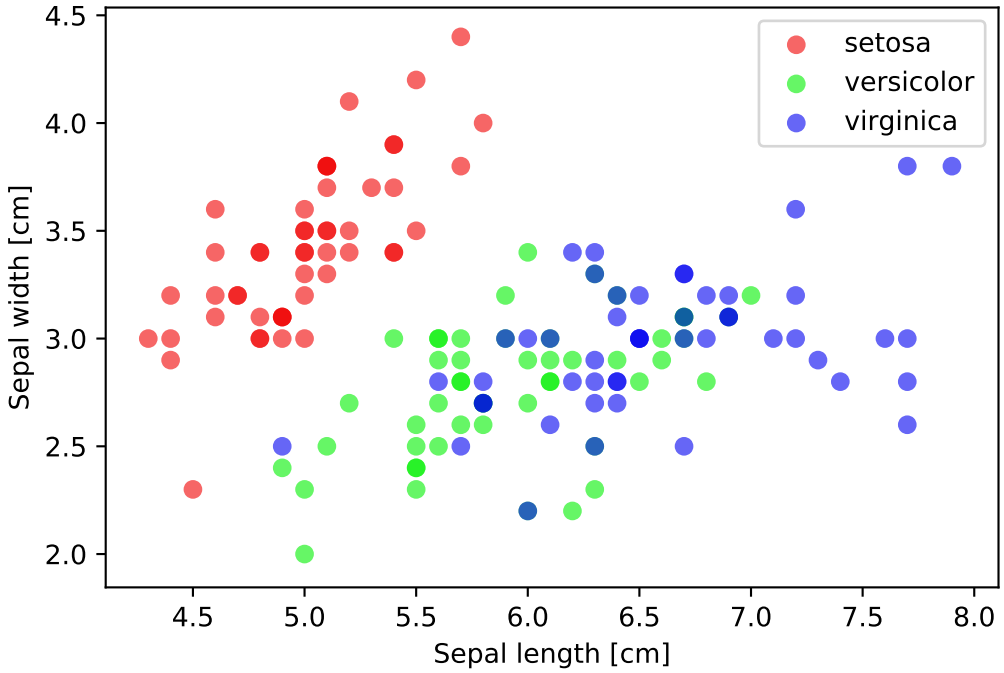

Figure 1: Scatter plot sepal width as a function of the sepal lenght for the iris dataset. As the legend indicates, the color code corresponds to the class.

- a Radial Basis Function kernel (RBF, see Figure 3)
- a degree 3 polynomial kernel (see Figure 4)
